## 1. Introduction

Previous reports, Research Records 126, 159, and 170, describe the application of different levels of a crosslinking agent to rib and interlock fabrics and the procedure for evaluation of the test data. Regression coefficients and correlation coefficients for a number of fabric properties as well as a graphical presentation of the results are given in these reports.

This report briefly describes the application of a further level of crosslinking agent (3½% o.w.f.) to the full range of fabrics and presents the results of a similar analysis of the data. Regression and correlation coefficients are given for this latest level of crosslinking agent as well as plots of the actual data points and the calculated curves for this level and also other levels.

## 2. Procedure

Five-metre lengths of all 62 fabric variants were prepared and assembled as described in Research Record 162. The finish identifiers used for this series were as follows.

### JDX4 and MJDX4

The following bath was used for the treatments carried out on the Shirley equipment as on previous occasions:

80 g/l	Fixapret CPN
12 g/l	MgCl <sub>2</sub> 6H <sub>2</sub> O
259/l	Siligen E
25g/l	Perapret PE40
1g/l	Synperonic NX
lcc/l	Acetic Acid

Wet pick-up, 90-100%

Drying with overfeed at 120°C

Curing for 45 seconds at 170°C

All fabrics were submitted to the testing laboratory for comprehensive testing.

## Analysis

The following mathematical relationships were taken and tested with the data from the latest treatment.

$$\text{courses/cm} = a + b/l + c \sqrt{(av\text{Tex})}$$

$$\begin{aligned} \text{wales/cm} &= a + b/1 + c \sqrt{(\text{avTex})} \\ \text{weight} &= a + b \cdot \text{Tex}/1 \\ \text{stitch density} &= a + b/1^2 + c \cdot \text{avTex} \\ \text{burst strength} &= a + b/1^2 + c \cdot \text{avTex} + d \cdot \text{avSES} \end{aligned}$$

In each case the equations predict the property in the fully relaxed or reference state. For each property in turn the regression coefficients and the correlation coefficients were obtained using the Tektronix statistical software package.

## Presentation of Results

Tables 1 and 2 give the properties of interest for the 1 x 1 rib fabrics.

Tables 3 and 4 give the properties of interest for the interlock fabrics.

The regression coefficients and correlation coefficients for the properties under investigation are given in the following tables.

Table	Property
5	courses/cm
6	wales/cm
7	stitch density
8	weight
9	bursting strength
10	Tex
11	Stitch length

Graphs of the actual data points and also the calculated curves are given in the Appendix as follows.

Fabric	Property	Figures
1 x 1 rib	courses	1-3
	wales	4-6
	stitch density	7-9
	weight	10-12
	bursting strength	13-15
	length shrinkage	16-18

Fabric	Property	Figures
Mercerised 1 x 1 rib	courses	19-21
	wales	22-24
	stitch density	25-27
	weight	28-30
	bursting strength	31-38
	length shrinkage	34-36

Fabric	Property	Figures
Interlock	courses	37-39
	wales	40-42
	stitch density	43-45
	weight	46-48
	bursting strength	49-51
	length shrinkage	52-54

Fabric	Property	Figures
Mercerised Interlock	courses	55-57
	wales	58-60
	stitch density	61-63
	weight	64-66
	bursting strength	67-69
	length shrinkage	70-72

## 5. Conclusions

As far as courses, wales, stitch density, bursting strength and length shrinkage are concerned the latest treatment has fallen into place with the curves ranked in order of increasing concentration of crosslinking agent. It is clear that we are approaching the point of diminishing returns and the one extra level which has already been carried out (5% o.w.f.) will be sufficient for a full analysis to establish equations where resin concentration is one of the variables.

The one property which has given cause for concern is relaxed weight. Figures 10-12, 28-30, 46-48 and 64-68 all show anomalies. The 2½% crosslinker level is showing lower relaxed weights than the 3½% crosslinker level.

An investigation into the possible causes of this is underway and the first impression is that the weight figures of the 2½% crosslinker level are suspect. Comparing the measured weight (Beta gauge) with the weight calculated from relaxed courses, wales, stitch length and Tex there is a discrepancy of over 20g/m<sup>2</sup> in most cases.

A decision will have to be taken regarding whether to average the measured and calculated weight figures or whether to use the calculated weight figures only.

Once this has been done, the regression equations for weight will have to be re-established for the 2½% o.w.f. level.
